

Survey Research Project:
Designing and Executing a Survey for Managerial Insights

IBM 6500

Stephanie Gutierrez, Marlen Garcia, Erika Barajas, and Abby Ortiz

1. Managerial Problem

Bean There Done That, a mid-sized regional coffee chain, has observed a decline in repeat purchases over the past six months. While the company continues to attract customers, internal data indicate that the average number of repeat purchases per customer per month has decreased across stores, signaling a growing challenge related to customer retention rather than customer acquisition.

Analytical Objectives

AO1: Examine how overall customer satisfaction (CS_OverallSatisfied) and product quality presentation (PQ_Presentation) influence customers repeating a visit again in 30 days (BL1_VisitAgain30Days). Multiple Regression will be conducted.

AO2: Assess the extent to which a customer satisfaction happy visit experience (CS_HappyExperience) influences customers repeating a visit again in the next 30 days (BL1_VisitAgain30Days). Cross Tabulation Chi-Square Test will be conducted.

A decline in repeat purchases is a significant concern for decision-makers at Bean There Done That because repeat purchases are essential for generating revenue, building brand loyalty, and maintaining a competitive position in the regional coffee market. If management at Bean There Done That understands how brand loyalty, price perception, product quality, and customer satisfaction shape a customer's likelihood of returning, they can make strategic marketing improvements to strengthen brand loyalty and drive repeat purchases.

2. Background and Conceptual Framework (Constructs)

Prior marketing research suggests that customers repeat purchase behavior is influenced by their perception of product quality, price-related considerations, and overall satisfactions with the brand. In service contexts such as coffee shops, these factors jointly shape brand loyalty, commonly conceptualized as a customer's intention to continue purchasing from the same brand. This present study examines how product quality, price consciousness, and customer satisfaction relate to brand loyalty among customers of Bean There Done That.

Brand Loyalty: Brand loyalty reflects a customer's intention to continue purchasing from the same brand in the future rather than past purchase frequency. Zeithaml, Berry, and Parasuraman (1996) conceptualize loyalty as a behavioral intention that captures customers' likelihood of returning to and preferring a service provider. Brand loyalty is measured using a combination of Likert-scale and behavioral (yes/no) items to capture both attitudinal intention and self-reported loyalty behavior.

Measurement:

- Likert Scale: (1 = strongly disagree, 5 = strongly agree):
 - “I am likely to choose Bean There Done That over other coffee shops.”
- Behavioral Yes/No Indicators
 - “Do you intend to visit Bean There Done That again in the next 30 days?” Yes/No
 - “Will you consider Bean There Done That the next time you want to buy coffee?” Yes/No

Price Consciousness: To which a consumer focuses exclusively on paying lower prices

Article: Lichtenstein DR, Ridgway NM, Netemeyer RG. Price perceptions and consumer shopping behavior: A field study. *Journal of Marketing Research*. 1993;30(2):234-245.

Even small price differences or available promotions at other stores may contribute to the slight decline in repeat coffee purchases

Measurement:

Likert Scale: (1 = strongly disagree, 5 = strongly agree):

- Likelihood of Switching Due to Price: “Saving money on coffee is important enough for me to look for low-price options.”
- Attention to Price: “I pay close attention to the price of coffee when I shop.”
- Perceived Importance of Price: “When choosing between coffee brands, price strongly influences my choice.”
- Promotion Responsiveness: “Promotions and discounts strongly influence which coffee brand I choose.”

Product Quality: Reflects the customer’s perceptions of taste, freshness, presentation, and overall experience with the beverages offered.

Declining beverage quality can cause overall dissatisfaction with the company and make customers less willing to return for future purchases.

Article: Jang SS, Namkung Y. Perceived quality, emotions, and behavioral intentions: application of an extended Mehrabian–Russell model to restaurants. *J Bus Res*. 2009;62(4):451-460.

Likert Scale: (1 = strongly disagree, 5 = strongly agree):

- Presentation: “The presentation of the drinks at Bean There Done That are visually attractive.”
- Taste: “Bean There Done That serves tasty beverages.”
- Freshness: “The ingredients used in the drinks at Bean There Done That seem fresh.”
- Overall Quality: “Overall, the product quality at Bean There Done That meets my expectations.”

Customer Satisfaction: Identifiable attributes that make up a product, service, or experience

Article: Anninou I, Stavradi G, Floh A. I can't get satisfaction: examining the moderating role of service brand authenticity in the relationship of imperfect experiences and satisfaction. *The Journal of Services Marketing*. 2024;38(7):839-856.

Likert Scale: (1 = strongly disagree, 5 = strongly agree):

- “Overall, I am satisfied with Bean There Done That.”
- “I am happy with my experience at Bean There Done That.”

Control Variables:

To account for potential demographics and behavioral differences, the survey includes the following control variables. These variables are used to describe the sample and ensure that observed relationships among the focal constructs are not driven by basic customer characteristics.

- Gender: Female, Male, Non-binary/other
- Age: 18-24, 25-34, 35-44, 45-54, 55-65, 65 years or older
- Income level: 20-40k, 50k-90k, 100k-150k, 200k or more
- Visit Frequency: “On average, how often do you visit Bean There Done That?”

Less than once a month About once a month 2-3 times per month
1-2 times per week 3-4 times per week Daily or almost daily

- Customer Tenure: “How long have you been a customer at Bean There Done That?”

Less than 3 months 3-6 months 6-12 months 1-2 years More than 2 years

3. Survey Design and Sampling

Survey was generated on Qualtrics then data was generated using ChatGPT 200 randomly generated respondents. Below is a QR Code for the survey from Qualtrics and preview of the survey.

Cal Poly Pomona

Brand Loyalty

I intend to visit Bean There Done That again in the next 30 days.

yes

no

To what extent do you agree or disagree with the following statements?

1 strongly disagree

2

3

4

5 strongly agree

I am likely to choose Bean There Done That over other coffee shops.

Will you consider Bean There Done That the next time you want to buy coffee?

yes

no

4. Data Preparation and Analysis

The data was generated on ChatGPT using the survey created from our constructs relating to our article references. was scanned for any missing values, outliers or anomalies. ChatGPT created data that needed to be transformed from categorical nominal data to scalable numerical data. This was needed to conduct any form of analytical analysis through SPSS.

Coefficients Table

The descriptive statistics table summarized how customers rated key constructs and provide an overview of general perceptions prior to further testing of relationships. In regards to revisit intention and brand loyalty, most customers indicated they intend to visit again within 30 days (BL1_VisitAgain30Days — Mean = .72 (0–1 scale)) suggesting a positive but not overwhelming loyalty. Similarly, results: BL3_RegularShop — Mean = .54 and BL2_ChooseOverOthers — Mean = 3.91 (1–5 scale) support that loyalty is present but customers are not fully committed. The Price Consciousness items indicate that customers show moderate to moderately high price sensitivity, they pay attention to price, are somewhat responsive to promotions, and may switch to cheaper alternatives. Satisfaction levels prove to be generally high with customers being happy with their experience.

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.841	.258		3.256	.001

AO1) Inferral Test (Model Summary, ANOVA, Coefficients)

A multiple regression inferral test was conducted to analyze analytical objective 1. ThisThe R value (.216) and R² (.047) indicate that the model explains about 4.7% of the variance in

customers’ intention to revisit Bean There Done That. The model is statistically significant confirming the predictors reliably contribute to explaining revisit behavior, just not strongly. The ANOVA table shows the

Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.216 ^a	.047	.037	.442

N of Valid Cases	200		

a. 2 cells (25.0%) have expected count less than 5. The minimum expected count is .28.

regression model is also statistically significant ($F=4.817$, $p=.009$), meaning that satisfaction and presentation do predict return intention and that the relationship is unlikely due to chance. We look at the Coefficients table to see how each factor individually affects revisit intention. Customer Satisfaction ($B=.081$, $p=.050$) has a positive but weak effect on revisit intention. This indicated that as customers feel more satisfied overall, they become slightly more likely to return. Presentation ($B=-0.108$, $p=0.020$) has a negative moderate effect. This suggests that customers rating product quality presentation more critically, are less likely to return.

AO2) Cross Tabulation

A Chi-square test was conducted to examine the association between revisit intention (BL1) and customer happiness (CS_HappyExperience). The relationship was statistically significant, $p = .029$, and the variance of 9.008. indicating that customers who reported being happier with their experience were more likely to express an intention to visit again. The crosstab results support this pattern: 86% of respondents with high happiness scores (4–5) indicated an intention to revisit, compared to much lower proportions among those with lower satisfaction scores. These results suggest that customer happiness is meaningfully related to revisit intention.

5. Managerial Insights and Recommendations

Across all analysis, customer satisfaction positively influences revisit intention. It is then essential for management from Bean There Done That to prioritize service and product improvements that create emotionally positive experiences for its customers. The first recommendation would be to improve emotional satisfaction to boost revisit intentions. Managers should assure Bean There Done that elevates customer experiences through friendlier service, faster ordering processes, and improved product freshness. The second recommendation is to standardize and enhance drink presentation to address a possible negative impact on return visits. Customers may feel that the current visual presentation does not meet their expectations. Managers can implement presentation standards and retain staff to ensure consistency. The last recommendation is to strengthen value perception through loyalty programs and promotions. Introducing value-based incentives such as loyalty rewards, targeted promotions and personalized discounts can make customers feel like they receive more value thus positively impacting customer retention and returns. By optimizing both the functional and emotional aspects of the customer experience, Bean There Done That can more effectively rebuild retention, encourage repeat visits, and cultivate a more loyal customer base.
